Chair Caddie CCB-2

Chair CADDIE Technology: an innovative seating solution designed to reduce the physical demands of caregivers, thereby preventing falls/injuries and making mealtimes easier and safer for both seniors and caregivers.

The dining room is the heart of every senior care community.
It is where we are nourished. It is where we gather.

It is good for the body, mind and soul. It is a public space, open to all.
It is at the dining table, where intergenerational relationships
are fostered and cherished.

The dynamics associated with aging, the loss of mobility and caregiving are complex and involved.

Seniors living with reduced mobility experience an overwhelming sense of being a burden or a nuisance. Often these once proud individuals will be seen sitting in awkward places for no reason other than they did not want to inconvenience anyone more than absolutely necessary.

Care staff endure a sense of helplessness as often they lack the physical strength to move a seated person to a place of greater comfort and enjoyment.

When moving a seated person, **care staff** feel more like hired muscle than givers-of-care as today's furniture technology fails to reduce the physical demands associated with providing meal time assistance.

Something has shifted in the expectation senior care communities have of furniture as it relates to providing person-centered care.

Prior to Covid, the design of dining tables and chairs focused primarily on augmenting a particular narrative for a senior care community. Much of the attention was drawn to fabrics and finishes. Flooring surfaces also tied into the narrative, with innovations addressing the seriousness of fall prevention, leading to softer more pliable surfaces being introduced.

Now, post Covid, senior care communities are asking, “what / how does your furniture make the task of front line care staff easier?”. This requires a different response from designers and manufacturers as the needs of care staff are now front and center.

Caring for those who care: ComforTek’s design team started by asking care staff “*What features would you like to see in a chair?*”

Care staff were quick to identify the physical toll of providing care, combined with the challenge of maintaining a relationship with a seated resident while providing meal time assistance. In most cases, meal time assistance involved plenty of ***pushing-pulling-shoving-twisting*** on the back of a chair simply to get a person seated at the table.

While **care staff** were quick to welcome these innovations, what we had not anticipated was the impact to other departments and budgets when mobility features were included on dining furniture.
